ccoltekin@sfs.uni-tuebingen.de

University of Tübingen
Seminar für Sprachwissenschaft

Winter Semester 2024/25

What is parsing?

- *Parsing* is the task of analyzing a string of symbols to discover its (inherent) structure
- Typically, the structure (and the valid strings in the language) is defined by a *grammar*
- The output of a parser is a structured representation of the input string, often a tree
- *Recognition* is an intimately related task which determines whether a given string is in a language

Ingredients of a parser

(for natural language parsing)

- A formal grammar defining a language of interest
- An algorithm that (efficiently) verifies whether a given string is in the language (recognizer) and enumerates the grammar rules used for verification (parser)
- A system for ambiguity resolution (not in this course)

Grammars

- A grammar is a finite specification of a possibly infinite language

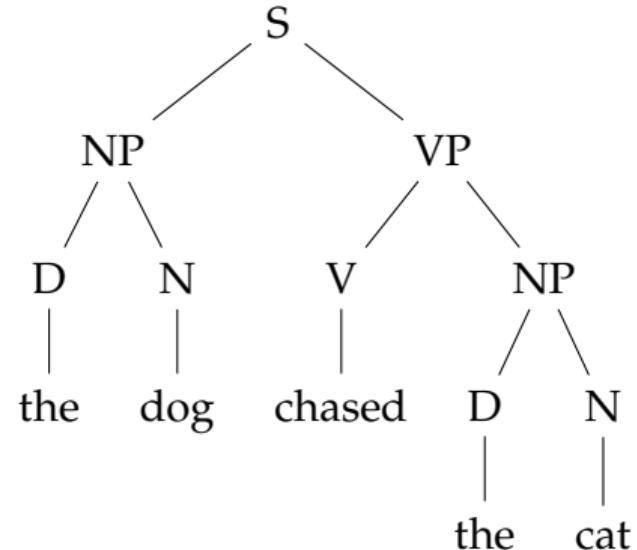

Grammars

- A grammar is a finite specification of a possibly infinite language
- The most commonly studied type of grammars are *phrase structure grammars*

$$S \rightarrow NP VP$$
$$V \rightarrow \text{chased}$$
$$NP \rightarrow D N$$
$$D \rightarrow \text{the}$$
$$VP \rightarrow V NP$$
$$N \rightarrow \text{cat}$$
$$N \rightarrow \text{dog}$$

Grammars

- A grammar is a finite specification of a possibly infinite language
- The most commonly studied type of grammars are *phrase structure grammars*
- Analysis using context-free grammars result in *constituency* or *phrase structure trees*

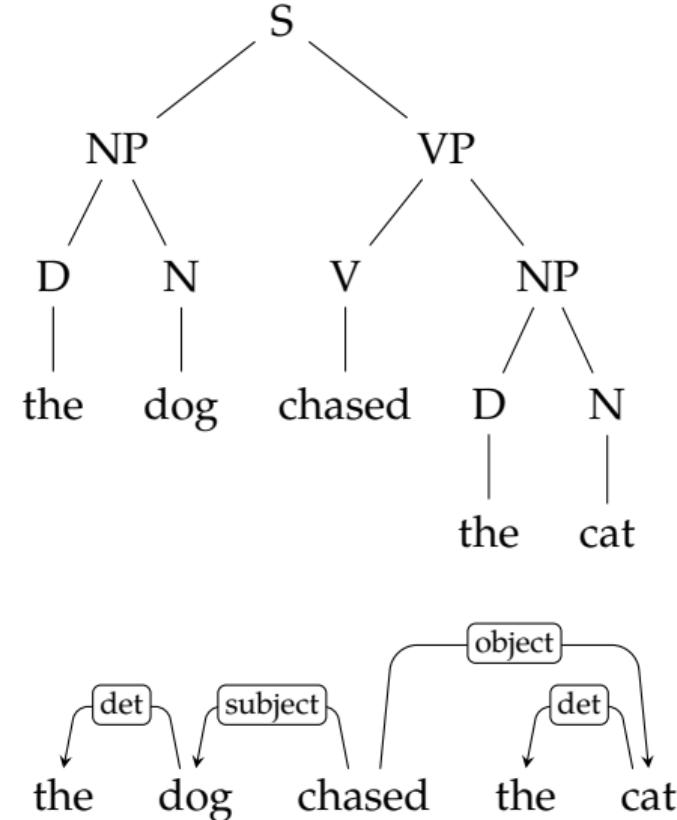

$$\begin{array}{l} S \rightarrow NP\ VP \\ V \rightarrow \text{chased} \end{array}$$

$$\begin{array}{l} NP \rightarrow D\ N \\ D \rightarrow \text{the} \end{array}$$

$$\begin{array}{l} VP \rightarrow V\ NP \\ N \rightarrow \text{cat} \\ N \rightarrow \text{dog} \end{array}$$

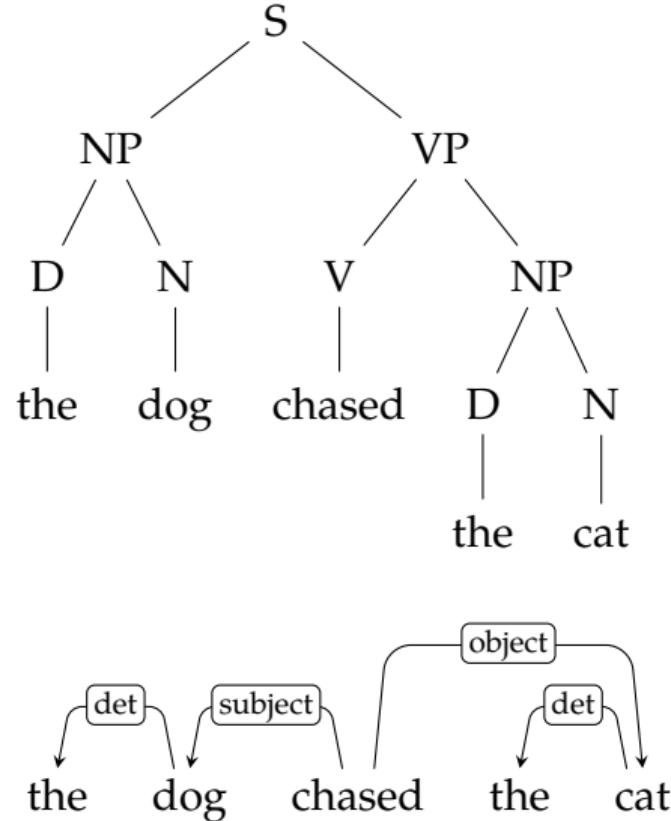

Why study parsing?

- In general, it is an intermediate step for interpreting sentences

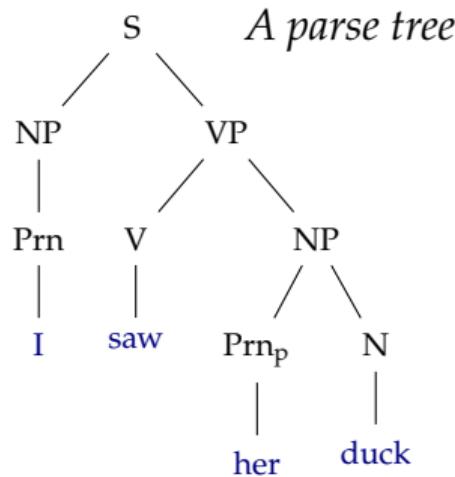

Why study parsing?

- In general, it is an intermediate step for interpreting sentences
- Applications include:
 - Compiler construction
 - Grammar checking
 - Sentiment analysis
 - Information (e.g., relation) extraction
 - Argument mining
 - ...

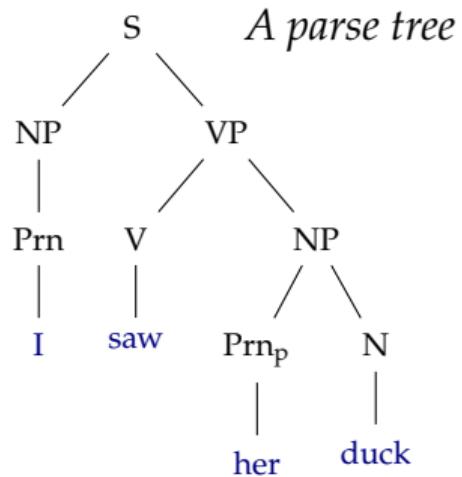

Different ways to represent a context-free parse

<i>A history of derivations</i>	
Sentential form	derivation
S	(start)
NP VP	S \Rightarrow NP VP
Prn VP	NP \Rightarrow Prn
I VP	Prn \Rightarrow I
I V NP	VP \Rightarrow V NP
I saw NP	V \Rightarrow saw
I saw Prnp N	NP \Rightarrow Prnp N
I saw her N	Prnp \Rightarrow her
I saw her duck	N \Rightarrow duck

(Labeled) brackets:
$$\left[\begin{smallmatrix} & \\ S & \left[\begin{smallmatrix} & \\ NP & \left[\begin{smallmatrix} & \\ \text{Prn} & \text{I} \end{smallmatrix} \right] \right] & \left[\begin{smallmatrix} & \\ VP & \left[\begin{smallmatrix} & \\ V & \text{saw} \end{smallmatrix} \right] \left[\begin{smallmatrix} & \\ NP & \left[\begin{smallmatrix} & \\ \text{Prnp} & \text{her} \end{smallmatrix} \right] \left[\begin{smallmatrix} & \\ N & \text{duck} \end{smallmatrix} \right] \right] \right] \end{smallmatrix} \right]$$

Different ways to represent a context-free parse

A history of derivations

Sentential form	derivation
S	(start)
NP VP	S → NP VP
Prn VP	NP → Prn
I VP	Prn → I
I V NP	VP → V NP
I saw NP	V → saw
I saw Prnp N	NP → Prnp N
I saw her N	Prnp → her
I saw her duck	N → duck

(Labeled) brackets: $\left[\begin{smallmatrix} & \\ S & \left[\begin{smallmatrix} & \\ \text{NP} & \left[\begin{smallmatrix} & \\ \text{Prn} & \text{I} \end{smallmatrix} \right] \right] & \left[\begin{smallmatrix} & \\ \text{VP} & \left[\begin{smallmatrix} & \\ \text{V} & \text{saw} \end{smallmatrix} \right] \left[\begin{smallmatrix} & \\ \text{NP} & \left[\begin{smallmatrix} & \\ \text{Prnp} & \text{her} \end{smallmatrix} \right] \left[\begin{smallmatrix} & \\ \text{N} & \text{duck} \end{smallmatrix} \right] \right] \end{smallmatrix} \right] \end{smallmatrix} \right]$

Relation between different representations

- The parse tree and the bracket representation is equivalent
 - parse trees are easier to read by humans
 - brackets are easier for computers
 - brackets are the typical representation for treebanks
- A parse tree (or bracket representation) can be obtained with a different order of production rules

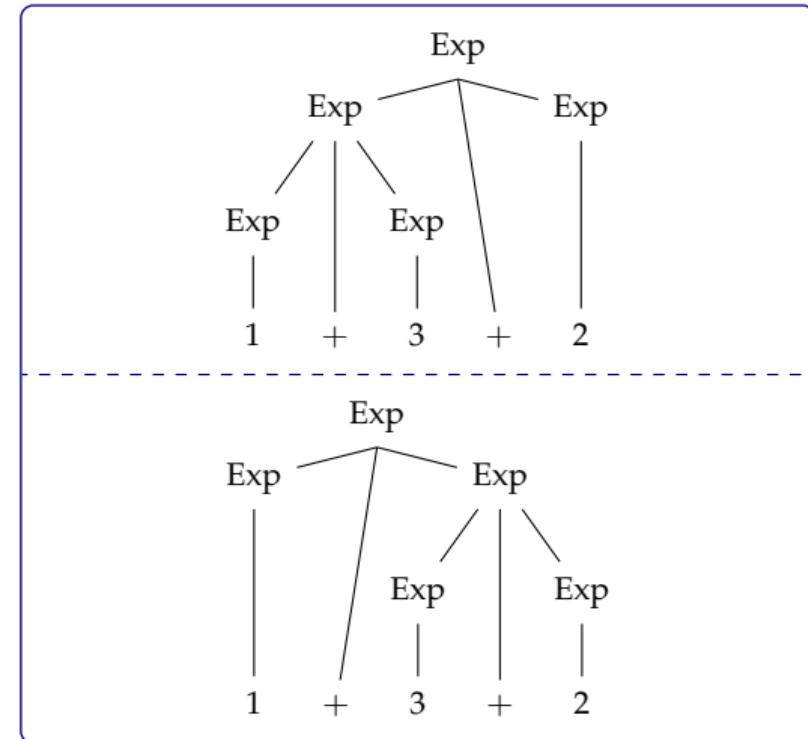

Grammars and ambiguity

$\text{Exp} \rightarrow \text{n}$

$\text{Exp} \rightarrow \text{Exp} + \text{Exp}$

(terminal symbol 'n' stands for any number)

- If a grammar is ambiguous, some sentences produce multiple analyses
- If the resulting analysis lead to the same semantics, the ambiguity is *spurious*

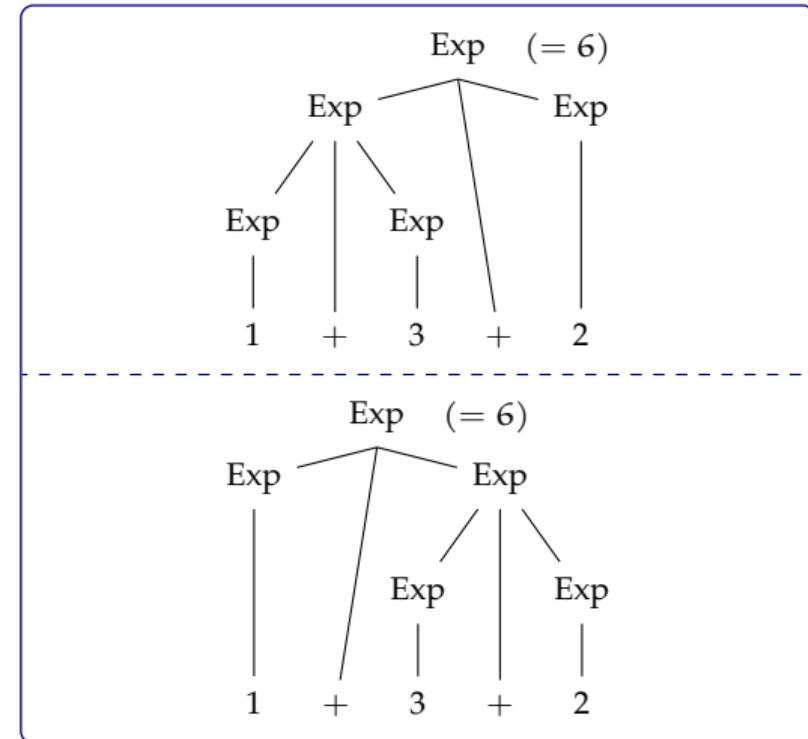

Grammars and ambiguity

$\text{Exp} \rightarrow \text{n}$

$\text{Exp} \rightarrow \text{Exp} + \text{Exp}$

(terminal symbol 'n' stands for any number)

- If a grammar is ambiguous, some sentences produce multiple analyses
- If the resulting analysis lead to the same semantics, the ambiguity is *spurious*

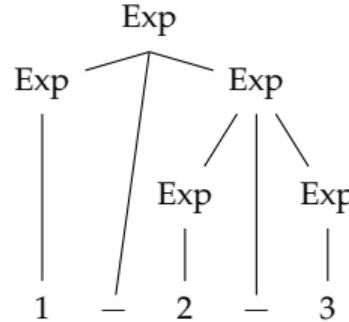

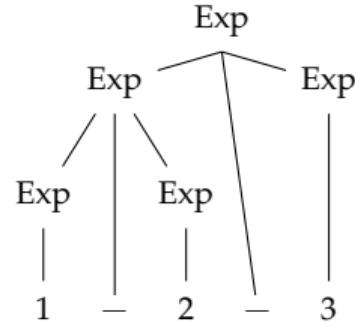

Grammars and ambiguity

```
Exp → n  
Exp → Exp - Exp
```

(terminal symbol 'n' stands for any number)

- Is this ambiguity spurious?

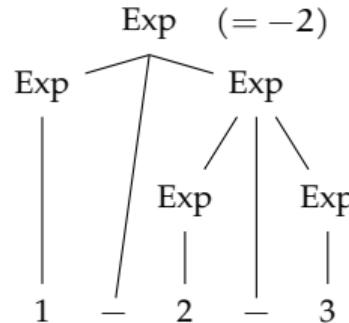

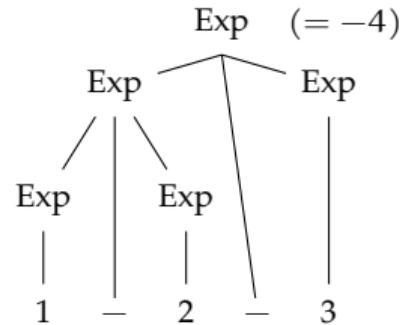

Grammars and ambiguity

```
Exp → n  
Exp → Exp - Exp
```

(terminal symbol 'n' stands for any number)

- Is this ambiguity spurious?
- If different structures yield different semantics, the ambiguity is *essential*

Ambiguity can be removed from a grammar

if the language is not ambiguous

$\text{Exp} \rightarrow \text{n}$

$\text{Exp} \rightarrow \text{Exp} + \text{n}$

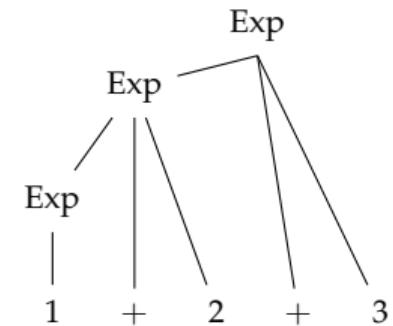

(terminal symbol 'n' stands for any number)

- The grammar above does not have the ambiguity of

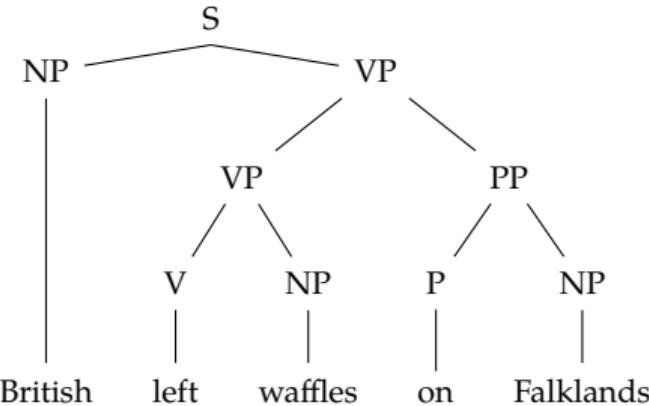

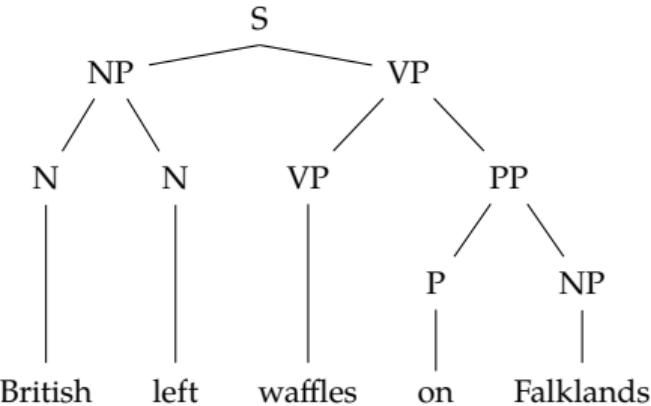

$\text{Exp} \rightarrow \text{n}$

$\text{Exp} \rightarrow \text{Exp} + \text{Exp}$

- Both grammars define the same language

Natural languages are ambiguous

- The grammars we define have to distinguish between two different structures
- We need methods for ranking analyses

Top-down parsing

general idea

- Start from S , find a sequence of derivations that yield the sentence
- This is simply the same as the generation procedure we discussed earlier
- Attempt to generate all strings from a grammar, but allow only the productions that ‘produce’ the input string

Top-down: demonstration

the cat bites a dog

S → NP VP
NP → Det N
VP → V NP
VP → V
Det → a
Det → the
N → cat
N → dog
V → bites

NP → Det N
VP → V NP
VP → V
Det → a
Det → the
N → cat
N → dog
V → bites
```

From demonstration to parsing

- There may be multiple productions applicable
- We need an automatic mechanism to select the correct productions
- We have two actions:
 - predict generate a hypothesis based on the grammar
 - match when a terminal symbol is produced, check if it matches with the one in the expected position
 - if matched, continue
 - otherwise, backtrack
- if we eliminate all non terminals from the sentential form, and the complete input string is matched (produced), then parsing successful

Note that the valid productions yield the parse tree.

Top-down parsing: problems and possible solutions

- The trial-and-error procedure leads to exponential time parsing

Top-down parsing: problems and possible solutions

- The trial-and-error procedure leads to exponential time parsing
- But lots of repeated work: dynamic programming may help avoid it

Top-down parsing: problems and possible solutions

- The trial-and-error procedure leads to exponential time parsing
- But lots of repeated work: dynamic programming may help avoid it
- What happens if we had a rule like

$$\text{NP} \rightarrow \text{NP PP}$$

Top-down parsing: problems and possible solutions

- The trial-and-error procedure leads to exponential time parsing
- But lots of repeated work: dynamic programming may help avoid it
- What happens if we had a rule like

$$\text{NP} \rightarrow \text{NP PP}$$

Top-down parsing: problems and possible solutions

- The trial-and-error procedure leads to exponential time parsing
- But lots of repeated work: dynamic programming may help avoid it
- What happens if we had a rule like

$$\text{NP} \rightarrow \text{NP PP}$$

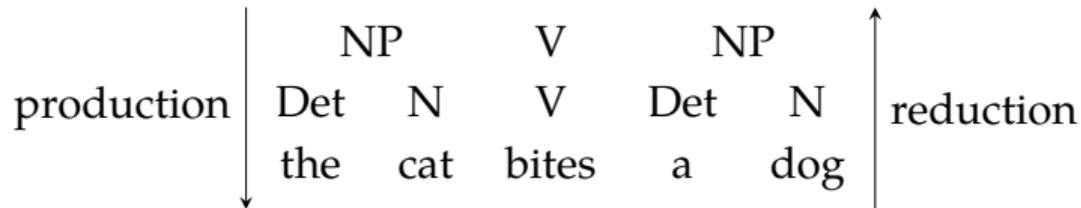

some rules may cause infinite loops

- Notice that if we knew which terminals are possible as the initial part of a non-terminal symbol, we can eliminate the unsuccessful matches earlier

Bottom-up parsing

general idea

- Start from the input symbols, and try to *reduce* the input to start symbol
- We need to match parts of the sentential form (starting from the input) to the RHS of the grammar rules
- While top-down process relies on *productions* the bottom-up process relies on *reductions*

A (first) introduction to shift-reduce parsing

- We keep two data structures:
 - a stack for the (partially) reduced sentential form
 - an input queue that contains only terminal symbols

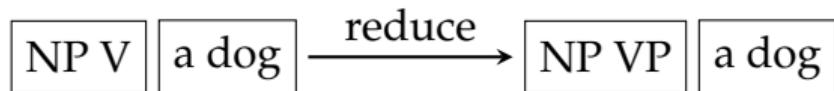

- We use two operations:

shift shifts a terminal to stack

reduce when top symbols on stack match a RHS, replace them with the LHS of the rule

Shift-reduce (bottom-up) parsing a demonstration

- All input reduced to S, accept
- Rules form the parse tree

Summary

- Parsing can be formulated as a top-down or bottom-up search (the search may also be depth-first or breadth first)
- Naive parsing algorithms are inefficient (exponential time complexity)
- There are some directions: dynamic programming, filtering
- Suggested reading (for constituency parsing): Jurafsky and Martin (2009, draft 3rd ed, chapters 12 & 13)
- A general reference for parsing: Grune and Jacobs (2007)
